

Solar Power for the People!

At Bellinghen Solar the future looks bright.

Currently system prices have never been more affordable; on a federal level "small scale technology certificates" are available to redeem healthy rebates. Electricity price rises have been estimated by the NSW government to increase 60% by the end of 2013, and the NSW government has committed to pay a fair price for grid fed solar, pending an IPART recommendation which is currently under way.

With feed in tariffs being in limbo till early 2012, it is of paramount importance when purchasing a PV system, to get accurate advice and educate yourself on exactly how net metering works and how to choose the right sized system for you and your lifestyle over the next decade.

Bellinghen Solar offers an obligation free site inspection; our goal is to find out how much power you currently consume during the daylight hours, and how your lifestyle may change the level of consumption in the future. We then do a rooftop inspection to assess orientation, shading so we can work out the best positioning and how many panels will fit.

We estimate the performance your installation can achieve, as well as how much energy and \$\$\$ you could save.

We explain the suite of products offered and together find the best fit.

Enclosed are three package pricelists for grid connect solar power systems, we have our price fighter, mid and premium range packages.

The systems are flexible and easily tailored to suit your needs.
